

## THE PROBLEM

Students and early professionals often seek opportunities to collaborate on projects outside of their coursework or workplace. However, finding teammates or opportunities is often difficult. Without a central hub, individuals struggle to match their skills and interests with the right opportunities.

## OUR SOLUTION

Peer.io is a mobile-based application where users can browse two interactive feeds: one for project ideas and one for potential collaborators. Using a like-dislike style interface, users can match with projects and peers. Once a mutual interest is established, messaging is available to facilitate collaboration.

## TECH STACK

Find a project! Find your team!

## THE MATCHING ALGORITHM

The project-to-person and person-to-project matching algorithms compute a composite score for each potential match using five weighted components.

1. Compute semantic similarity using pre-trained sentence transformer model (all-MiniLM-L6-v2). Vector embeddings are generated and compared using cosine similarity.
2. Calculate the number of matched and missing skills required
3. Calculate interest alignment by measuring overlap of user interests and project tags.
4. Combine components with stored Elo, a dynamic reputation indicator

## RESUME PARSER

Accepts file and converts it into a structured representation, used to populate the user's profile.

1. Tries to read the resume as a digital PDF by extracting selectable text from the document.
2. When extracted text is too short, pipeline falls back to an OCR stage.
3. Leverages GPT to organize and split text into Education, Experience, Projects, and Skills.
